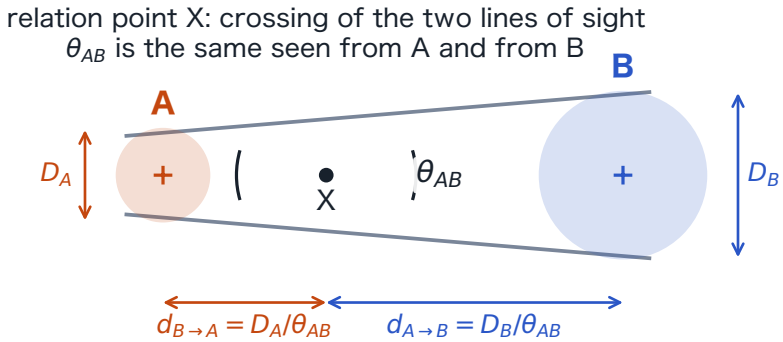
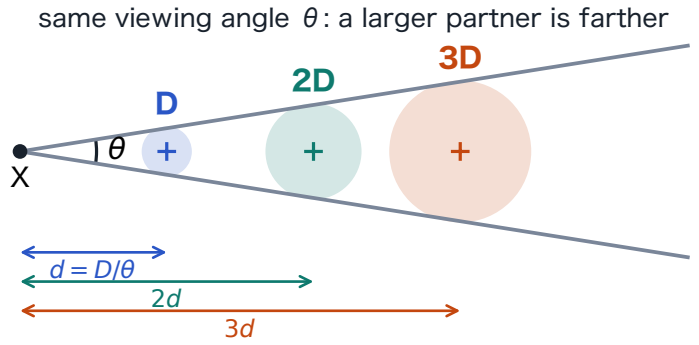
Fig. 1 Viewing angle and size (P1): only the angle and size ratios are readable

(a) two bodies: shared viewing angle and the partner's size

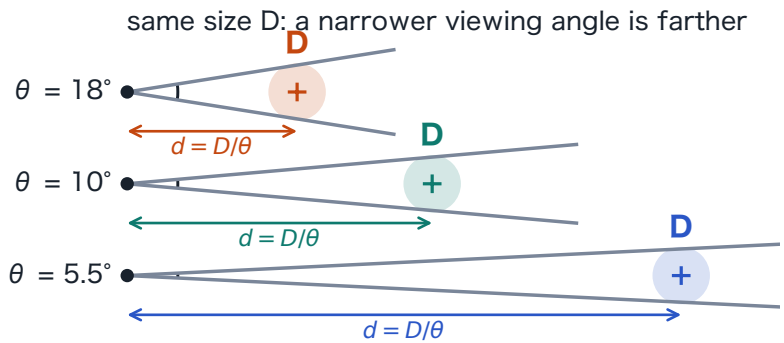


θ_{AB} = 32.1°, $d_{A\to B}/d_{B\to A} = D_B/D_A$ = 1.82 (as the formula says; exactly $d = D/(2\sin(\theta/2))$, D/θ for small angles)

(b) at the same viewing angle, a larger partner is farther



(c) a narrower viewing angle is farther



(d) oneself: the two lines are parallel, viewing angle 0

the seeing and the seen lines are parallel: θ_{AA} = 0
no crossing, so no distance (one cannot observe oneself)
